

# Modern Endpoint Management Pilot with Microsoft Intune

---

This offering focuses on deploying a set of “greenfield” endpoints using Microsoft’s modern endpoint management tools. CompuNet engineers will take a “teach to fish” approach, walking the customer staff through a baseline best practices deployment and leaving them with the skills to expand that deployment to their particular use cases. As the scope of the pilot is fixed, it remains a consistent scope regardless of customer size.

## Target Customer Profile

- Has or interested in M365 licensing
- Struggles with managing remote users
- Interested in reducing reliance on on-premises infrastructure

## Qualifying Questions

- How are you managing endpoints for remote users?
- Do you have an initiative to use MFA on endpoints?
- How do you handle software patching on endpoints?
