

Windows 365

WHAT IS WINDOWS 365 ?

Windows 365 is a cloud-based version of the Windows operating system, where a user can access a virtualized instance of Windows running on remote servers and accessing it over the internet. This service allows users to run Windows applications on any device with an internet connection, without the need for a physical Windows machine. Instead of purchasing a single, one-time license for the software, customers pay a monthly or annual fee to access the latest features and updates.

A SUCCESSFUL CLOUD IMPLEMENTATION

Based on the Cloud Readiness Assessment recommendation, we are going to assess your infrastructure to implement Windows 365. Some prerequisites are required to design a secure and efficient solution to provide you the best user experience.

OUR CLOUD MIGRATION STRATEGY

Our Cloud experts will design the cloud infrastructure to be ready with Windows 365. We will implement a Windows 365 landing zone while complying with your business, regulatory and legal information.

PILOT PHASE

This phase will allow us to validate the technical capabilities and the security expectation of the platform. We are working on different workshops with your different teams (business, network, backup, security) to validate the design.
