

In standard Business Central you can see what an item's resource cost is at an individual level or accumulated level.

With Production Order Cost Calculation you can follow it all the way down to the operational level and distinguish between Setup time and Operation time, as well as between direct and indirect costs.

This allows you to quickly compare what the cost should have been according to the Routing and BOM, in relation to what the actual cost was. Thus, you can quickly and effectively correct the master data.

For Finance

- Avoid large inventory discrepancies at the annual inventory count - by getting warehouse and items-inassembly values that match all the time.
- Focus more on discrepancies while also improving quality faster.
- Make sure data is correct and enable the production to deliver accurate projections to the finance department.

For Planning

- By comparing the projected cost and time with the registered cost and time, you can see the deviation of material consumption and time registered.
- Quickly find the largest and most important discrepancies in operations or materials you want to correct right away.

For Production

- The organization will get a habit of correcting data continuously.
- This easy tool to track discrepancies will constantly keep data correct.
- Be able to explain the cause of discrepancies much more effectively.
